                                                                                                                     factor
                                                                                                                                                            Peptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DI or the activation of transcription by E2F-1/DP-1 heterodimers. The may also be used for inducing apoptosis and/or cell cycle arrest a cell, particularly for treatment of cancer or other proliferationsorders such as psoriasis and restenosis.

AAR60400-73 are peptide ligands which bind to purified Igm lambda receptor of the human Burkitts's lymphoma cell line SUP-BB.Peptides AAR60414 to AAR60473 were biotinylated and linked to streptavidin. The peptides were identified with the use of filamentous phage libraries displaying random peptides. Corresponding synthetic peptides bound specifically to this Ig receptor, and blocked the binding of an anti-idiotype antibody. The ligands, when conjugated to form dimers or tetramers, induced cell death by apoptosis in vitro at nanomolar concentrations. This effect was associated with the specific stimulation of intracellular protein tyrosine phosphorylation. The peptides of the invention can be used individually, as complexes of cross-linked peptides or can be conjugated to deliver toxins or radionuclides to neoplastic cells bearing the specific Ig

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and Dl or the activation of transcription by E2F-1/DP-1 heterodimers. The may also be used for inducing apoptosis and/or cell cycle arrest a cell, particularly for treatment of cancer or other proliferationsorders such as psoriasis and restenosis.
                                                                                                                                                                                                                                                                                                           Peptide which binds to transcription factor E2F-1 DNA binding do
                                                                                                                                                                                                                                                                                                                                            DP-1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR60400-73 are peptide ligands which bind to purified IgM lambda receptor of the human Burkitts's lymphoma cell line SUP-B8.Peptides

AAR60414 to AAR60473 were biotinylated and linked to streptavidin.

The peptides were identified with the use of filamentous phage
libraries displaying random peptides. Corresponding synthetic

peptides bound specifically to this Ig receptor, and blocked the binding of an anti-idiotype antibody. The ligands, when conjugated to form dimers or tetramers, induced cell death by apoptosis in vitro at nanomolar concentrations. This effect was associated with the specific stimulation of intracellular protein tyrosine phosphorylation. The peptides of the invention can be used individuall as complexes of cross-linked peptides or can be conjugated to deliver toxins or radionuclides to neoplastic cells bearing the specific Ig

                                                                                                                                                                                                                                                                                  comprises
                                                                                                                                                                                                                                                                                                                                                             The (Group II) peptide is an example of a generic peptide of for R-(Lys/Arg/His - Phe/Tyr/Trp - Leu/Ile/Val )n-R, where n = 1-10 and each R is H, an amino acid residue or a fatty acid residue. The peptide is useful for treating or preventing septic shock, mixing with polymyxin B to reduce its toxicity; removing endotoxins from blood, sera or other fluids (in vivo or in vitro); controlling release of cytokines induced by endotoxins; as diagnostic reagents to detect and quantify toxins in blood or sera; preparing non-toxic antigenic complexes of lipid A or lipopolysaccharide (LPS); and for treating pertussis, bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         meningitis and HIV-related infections. The usual dose is 10-100 ug/kg/day, given parenterally. It binds to the same sites as polymyxin B, i.e. it inhibits all the toxic effects of lipid A. has no antibiotic activity; does not lyse erythrocytes; has no toxicity in mice when injected at 50mg/kg and is relatively unst
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and for treating pertussis, bacterial

The patent discloses eight new groups of opioid peptides which bind to the mu-receptor to act as agonists or antagonists. The peptides can be used for in-vitro assays to study opiate receptor subtypes (especially the mu type) in brain or other tissue samples; and for in-vivo diagnosis to localise opioid subtypes. The peptides are also useful as drugs to treat pathologies associated with other compounds which interact with the opioid receptor system. Therefore they can be used in medicaments for treating pathologies associated with the mu receptor and as analgesics. They can be used therapeutically to block the peripheral effects of centrally acting pain killers, e.g. to prevent side effects such as constipation and pruritis associated with morphine. The present sequence represents a specific example of one of the new groups of peptides, of formula

Ac-Arg-Trp-Ile-Gly-Trp-Xaa-NH2 where Xaa = a naturally occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Opioid peptide; ligand binding; opioid receptor;

The peptides inhibit ligand binding to an opioid receptor. Specifically, the peptides inhibit the micro-selective opioid peptide enkephalin. The peptides can be used in vivo diagnostically to localize opioid receptor subtypes. They can be used to treat pathologies associated with other compounds which interact with the opioid receptor system. The peptides are especially useful for blocking the peripheral effects of centrally acting pain killers such as morphine. AAY23005-Y23024 represent opioid peptides of the invention, and are derived from the general sequence given in AAY23004.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a composition (I) comprising stress protein-peptide complexes (SPPC) associated with tumours that is specifically immunogenically cross-reactive with cell surface-associated SPPCs specific to target cancer (TC). Also described is an isolated antigen-binding fragment of an antibody that binds specifically to SPPCs or a population of different SPPCs consisting of immunogenic cancer cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the

                                                                      rector E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP-1 or the activation of transcription by E2F-1/DP-1 heterodimers. They may also be used for inducing apoptosis and/or cell cycle arrest in a cell, particularly for treatment of cancer or other proliferative disorders such as psoriasis and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                       stress protein-peptide complex;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to

surface-associated SPPC of TC. (I) has cytostatic activity and can be used in vaccine production and as a tumour-specific immunogenic response inducer. (I) is useful for treating 71 types of cancers or tumours in a subject, such as astrocytoma, fibrosarcoma, myxosarcoma, liposarcoma, oligodendroglioma, ependymoma, medulloblastoma, and primitive neural ectodermal tumour (PNET). (I) is useful as cancer immunogen including vaccines. (I) is useful for diagnostic and palliative use, for detecting or imaging cancer cells, and to monitor the course of amelioration of malignancy in an individual. AAM43707 to AAM47109 represent peptides which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                     7 AA;

New peptide(s) that bind to endothelial leukocyte adhesion molecule 1 - useful for treating inflammation and other E-selectin mediated diseases

Disclosure; Page 17; 85pp; English.

involved to E-selectin, nity for the alkyl ON (R6) (SLe-x) tics This . The peptide are up to 100 micromole that bind to endothelial leukocyte adhesion molecule (ELAM)-1. This that bind to endothelial leukocyte adhesion molecule (ELAM)-1. This molecule is a member of the selectin family of receptors and is inverse in binding of leukocytes to the vascular endothelial wall prior to extravasation of the leukocyte, e.g. to a site of inflammation.

The peptides bind pref. to E-selectin but may also bind L- or P-selectin, and can be used to treat conditions mediated by E-selectin e.g. inflammatory conditions. The peptides have strong affinity for selectin receptors and inhibit the binding of the sialyl Lewis (SLepart of cell surface glycoproteins to E-selectin. The peptide are small, generally less than 2 kD, have an IC50 of up to 100 micromole against binding of HL60 cells to ELAM-1, have one or more peptide in hinkages replaced by CH2OC(0)NR, phosphonate, CH2SO2NR, CH2NR, CON(H) or NHCONH linkages where R = H or a lower alkyl and R6 = a lower alkyl

New peptide(s) that bind to endothelial leukocyte adhesion molecule 1 - useful for treating inflammation and other E-selectin mediated diseases

Disclosure; Page 17; 85pp; English.

Peptides AAR86024-R86236 are examples of peptides and their mimetics that bind to endothelial leukocyte adhesion molecule (ELAM)-1. This molecule is a member of the selectin family of receptors and is involved in binding of leukocytes to the vascular endothelial wall prior to extravasation of the leukocyte, e.g. to a site of inflammation.

The peptides bind pref. to E-selectin but may also bind L- or p-selectin, and can be used to treat conditions mediated by E-selectin, e.g. inflammatory conditions. The peptides have strong affinity for the selectin receptors and inhibit the binding of the sialyl Lewis (SLe-x) part of cell surface glycoproteins to E-selectin. The peptide are small, generally less than 2 kD, have an IC50 of up to 100 micromole against binding of HL60 cells to ELAM-1, have one or more peptide are linkages replaced by CH2OC(O)NR, phosphonate, CH2SO2NR, CH2NR, CON(R6), or NHCONH linkages where R = H or a lower alkyl and R6 = a lower alkyl. The peptides may also have substituted N- and C-termini e.g. The peptides may also have substituted N- and C-termini e.g.

This molecule is a member of the selectin family of receptors and is invo in binding of leukocytes to the vascular endothelial wall prior to extravasation of the leukocyte, e.g. to a site of inflammation.

The peptides bind pref. to E-selectin but may also bind L- or P-selectin, and can be used to treat conditions mediated by E-select e.g. inflammatory conditions. The peptides have strong affinity for selectin receptors and inhibit the binding of the sialyl Lewis (SLepart of cell surface glycoproteins to E-selectin. The peptide are small, generally less than 2 kD, have an IC50 of up to 100 micromole against binding of HL60 cells to ELAM-1, have one or more peptide inkages replaced by CH2OC(0)NR, phosphonate, CH2SO2NR, CH2NR, CON(R) or NHCONH linkages where R = H or a lower alkyl and R6 = a lower alk succinimido, N-benzyloxycarbonyl or N-lower alkyl cpds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to A

The peptides have applications for the treatment of conditions mediated by E-selectin, e.g. inflammatory conditions. They can also be used for diagnostic purposes, e.g. for identifying the vascular site of E-selectin vivo or can be coupled to anti-inflammatory or other drugs.                                                                                                                                                                                                                                                  AAW63846-W64054 are peptides and peptide mimetics that bind selectins including endothelial leukocyte adhesion molecule 1 (ELAM-1) and can be used for blocking adhesion of leukocytes to the selectins. The peptides have applications for the treatment of conditions mediated by E-selectin, e.g. inflammatory conditions. They can also be used for diagnostic purposes, e.g. for identifying the vascular site of E-selectin vivo or can be coupled to anti-inflammatory or other drugs. (Updated on 25-MAR-2003 to correct PF field.)

The peptides have applications for the treatment of conditions mediated by E-selectin, e.g. inflammatory conditions. They can also be used for diagnostic purposes, e.g. for identifying the vascular site of E-selectin vivo or can be coupled to anti-inflammatory or other drugs.                                                                                                                 The (Group II) peptide is an example of a generic peptide of formula R-{ Lys/Arg/His - Phe/Tyr/Trp - Leu/Ile/Val }n-R, where n = 1-100 and each R is H, an amino acid residue or a fatty acid residue.

The peptide is useful for treating or preventing septic shock, mixing with polymyxin B to reduce its toxicity; removing endotoxins fron blood, sera or other fluids (in vivo or in vitro); controlling release of cytokines induced by endotoxins; as diagnostic reagents to detect and quantify toxins in blood or sera; preparing non-toxic antigenic complexes of lipid A or lipopolysaccharide (LPS); and for treating pertussis, bacterial meningitis and HIV-related infections. The usual dose is 10-100 ug/kg/day, given parenterally. It binds to the same sites as polymyxin B, i.e. it inhibits all the toxic effects of lipid A. It has no antibiotic activity; does not lyse erythrocytes; has no toxicity in mice when injected at 50mg/kg and is relatively unstable
                                                                                                                                                                                                                                                                                                            is relatively unstable

                          The invention relates to somatostatin antagonists that can be used to promote the growth of meat-producing animals by decreasing the effect of somatostatin and/or increasing the release of growth hormone, insulin, glucagon and/or gastric enzymes and/or enhancing immune function. Pure somatostatin antagonists may also be useful for treating human or animal disorders where reversal of somatostatin activity is beneficial, e.g. gastrointestinal or eating disorders, diabetes or brain dysfunction. The present sequence represents a somatostatin antagonist.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes linear and cyclic peptides, which decrease the effect of somatostatin. The somatostatin antagonist peptides are used for decreasing the effect of somatostatin, by contacting a somatostatin receptor site. They are also used for increasing the release of jucagon, enhancing the growth of animals and enhancing immune function. They can be used to treat gastrointestinal and eating disorders, diabetes and brain dysfunction, and also to increase growth in meat producing animals. The peptides demonstrate inverse agonist activity. This allows them to act as pure somatostatin antagonists, while blocking intrinsic somatostatin receptor activity, independent of endogenous somatostatin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders includicardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Combination of peptides derived from chemotaxis inhibiting prote Staphylococcus aureus (CHIPS) having CHIPS activity, useful in prophylaxis and treatment of inflammation, cardiovascular, skin kidney diseases

                                                                                                                                                                                                                                                                                                                                                for coagulation factor VIII which can be used for for labeling, identification (diagnostic) and purification of factor VIII. Some are specific for one of natural and recombinant factor VIII, others are reactive with both forms. Factor VIII is used to treat disorders of blood coagulation. Using relatively small peptides, rather than large antibody molecules generally used, simplifies purification of factor VIII. The peptides are of formula R1-X-R2 where R1 = amino or a peptide; R2 = carboxy or a peptide and X = a peptide of at least 3, preferably 7-12, amino acid residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                        AAW80372-93 represent peptides eluted after biopanning against maltose binding protein, in the course of the invention. The specification describes IVPS (intervening protein sequence) regions which encode peptides which are removed via protein splicing to form the native protein. The specification describes a modified protein comprising a target protein or portion, fused either internally or terminally, to a IVPS, or to an amino- or carboxyl-terminal element of a IVPS. The IVPS are capable of excision from or cleavage of the modified protein upon predetermined conditions, in cis or trans, e.g. temparature increase, deglycosylation unblocking of amino acid residues, treatment with chemical reagents. The methods can be used for modifying, producing, purifying, labelling or isolating target proteins such as enzymes, toxins, cytokines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nerapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fusogenic; nuclear localisation signal; NLS; encapsulation; lipogene; liposome; micelle; karyophilic; cytostatic; antitumour; solid tumour; peptide-lipid-polynucleotide complex; neoplastic disease; gene therap

The present invention describes a method for producing micelles with entrapped therapeutic agents. The method comprises: (1) combining negatively charged agent with a cationic lipid in a ratio where 30-90 % of the negatively charged atoms are neutralised by positive charges on lipid molecules to form an electrostatic micelle complex in 20-80 % ethanol; of combining the micelle complex of a with fusogenic-karyophilic peptide conjugates in a 0.0-0.3 ratio, therefore producing micelles with entrapped therapeutic agents. Also described is a method for delivering a therapeutic agent in vivo, comprising the administration of the micelle. ABB74256 to ABB74858 represent specifically claimed nuclear localisation signal (NLS) peptides for use in the method as the fusogenic-karyophilic peptides. The micelles produced can have cytostatic and antitumour activities. The peptide-lipid-polynucleotide complexes produced are useful for inhibiting the progression of neoplastic diseases. The invention relates to the field of gene therapy and is diseases. The invention relates to the field of gene therapy and is directed toward methods for producing peptide-lipid-polynucleotide complexes suitable for delivery of polynucleotides. The encapsulated molecules display therapeutic efficacy in eradicating solid tumours including but not limited to breast carcinoma or prostate carcinoma.

ABB74235 to ABB74255 are used in the exemplification of the present

                                                                                                                        This invention relates to an SH3 domain-containing protein termed TADGS, and its variants. The invention includes amino acid and polynucleotide sequences for TADGS, and oligonucleotides which bind to either the basic amino acid region and/or the zinc finger motif of the TADGS protein. The regulating the expression of the TADGS gene in a cell. The TADGS protein is useful as a source of amino acids, as a nutrition supplement, and as marker for human tissue, or in cell cycle control. TADGS protein or peptides generated from the protein sequence are useful as antigens for the production of polyclonal and monoclonal antibodies. DNA encoding TADGS is useful as an antisense vehicle for cell cycle control by shutting down signalling or cell division. The present sequence represents a peptide identified from a phage display peptide library through biopanning with the TADGS protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Toxic shock; blood endotoxin removal; serum; diagnostic reagent; cytokine release control; treatment; pertussis; bacterial meningitis; HIV related infections; polymyxin B; Group I.
lipoprotein (LDL) receptor gene mutations. The method can be used in diagnosis of an inherited predisposition to the development of diseas associated with hyperlipaemia, such as arteriosclerosis and ischaemic heart disease. ABL91141 encodes the LDL receptor given in ABB90525. ABL91142 to ABL91183 represent PCR primers used in the amplification the receptor gene. ABL90990 to ABL91140 and ABB90445 to ABB90524 represents sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The (Group I) peptide is an example of a generic peptide of formul R-(Lys/Arg/His - Phe/Tyr/Trp - Leu/Ile/Val)n-R, where n = 1-100 and each R is H, an amino acid residue or a fatty acid residue. The peptide is useful for treating or preventing septic shock, mixing with polymyxin B to reduce its toxicity; removing endotoxins fron blood, sera or other fluids (in vivo or in vitro); controlling release of cytokines induced by endotoxins; as diagnostic reagents to detect and quantify toxins in blood or sera; preparing non-toxic antigenic complexes of lipid A or lipopolysaccharide (LPS); and for treating pertussis, bacterial

R - ( Lys/Arg/His - Phe/Tyr/Trp - Leu/Ile/Val )n-R, where n = 1-100

and each R is H, an amino acid residue or a fatty acid residue.

The peptide is useful for treating or preventing septic shock,

mixing with polymyxin B to reduce its toxicity; removing

endotoxins fron blood, sera or other fluids (in vivo or in

vitro); controlling release of cytokines induced by endotoxins;

as diagnostic reagents to detect and quantify toxins in blood

or sera; preparing non-toxic antigenic complexes of lipid A or

lipopolysaccharide (LPS); and for treating pertussis, bacterial

c neningitis and HIV-related infections. The usual dose is 10-100

c ug/kg/day, given parenterally. It binds to the same sites as

c ug/kg/day, lie. it inhibits all the toxic effects of lipid A. It

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent describes novel cyclic hexapeptide and octapeptide compounds which are antagonists of neurokinin A and which are useful medically as analgesics and for treating respiratory diseases such as asthma. The patent also discloses the new use of a broader range of cyclic hexapeptides as analgesics and for treating respiratory diseases such as asthma. The present sequence represents a specifically preferred

The patent describes novel cyclic hexapeptide and octapeptide compounds which are antagonists of neurokinin A and which are useful medically as analgesics and for treating respiratory diseases such as asthma. The present sequence represents a specifically preferred example of the new peptides.
                                        tachykinin; respiratory disease; asthma;

Peptides AAR86024-R86236 are examples of peptides and their mimetics that bind to endothelial leukocyte adhesion molecule (ELAM)-1. This molecule is a member of the selectin family of receptors and is involved
                                                                                                                                          prohormone of the
                                                                                                                                                       part 100 for the peptides are generated by internal processing of the prohormone at the Ser-Leu and Lys-Lys sequences. This peptide is designated SAP bombesin-10 ("BIM-26336") and corresponds to residues 49-58 of the prohormone. The SAP bombesin-10 is then modified from prohormone-cleaved peptide by having an amidated methionyl residue. This peptide can be generated by an internal cleavage of the SAP bombesin-14 (AAR74032). The amide gp. being donated from the Gly rest position 59 of the prohormone. The peptides have applications will human and veterinary medicine, especially to treat the diseases or disorders specified in US5217955, WO9402018 and WO9220363.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide(s) that bind to endothelial leukocyte adhesion molecule 1 - useful for treating inflammation and other E-selectin mediated

in binding of leukocytes to the vascular endothelial wall prior to extravasation of the leukocyte, e.g. to a site of inflammation. The peptides bind pref. to E-selectin but may also bind L- or P-selectin, and can be used to treat conditions mediated by E-selectin, e.g. inflammatory conditions. The peptides have strong affinity for the selectin receptors and inhibit the binding of the sialyl Lewis (SLe-x) part of cell surface glycoproteins to E-selectin. The peptide are small, generally less than 2 kD, have an IC50 of up to 100 micromole against binding of HL60 cells to ELAM-1, have one or more peptide linkages, replaced by CH2OC(0)NR, phosphonate, CH2SO2NR, CH2NR, CON(R6), or NHCONH linkages where R = H or a lower alkyl and R6 = a lower alkyl. The peptides may also have substituted N- and C-termini e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW63846-W64054 are peptides and peptide mimetics that bind selectins including endothelial leukocyte adhesion molecule 1 (ELAM-1) and can be used for blocking adhesion of leukocytes to the selectins. The peptides have applications for the treatment of conditions mediated by E-selectin, e.g. inflammatory conditions. They can also be used for diagnostic purposes, e.g. for identifying the vascular site of E-selectin vivo or can be coupled to anti-inflammatory or other drugs. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of a peptide isolated by panning with the D32.39 antibody, with an ELISA result of 0.1. This was done as an example of a method of constructing a random peptide library of at least 10(6) members. The method enables the generation, screening and selection of peptide ligands and receptor molecules. Peptides generated using the method can be used in therapeutics and diagnostics, e.g. to inhibit receptor activity. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                        A random peptide library was constructed in E.coli hosts.

The library was lysed and panned using antibody D32.39 which recognises the Dynorphin B epitope RQFKVV. Peptides isolated by panning were sequenced and a consensus epitope was identified (see features table). Arginine is invariant in the first position for all the ELISA positive clones (AAR56701-R56758). No strong bias was evident for the second position but in the third position, 5 amino acids (Phe, His, Asp, Tyr, Trp) account for 98% of the residues. The fourth position shows a strong bias for positively charged residues (Lys and Arg) with almost exclusively hydrophobic residues at position 5 (mostly Val). Val and Thr predominate at the sixth position (76%) with Ser and Ile accounting for the remaining amino
                                                                                                             Dynorphin B; epitope; antibody panning; random peptide library; antibody D32.39; ligand screening.
                                                                                                                                                                                                                                                                                                                                                                                       Construction of random peptide library - by creating vectors contg. The RP library can be used to screen for novel ligands, the method resulting in the formation of a complex comprising the fusion protein bound to a receptor through the ligand and to the recombinant DNA vector through the DNA BP. An RP library (AAR91450-506) was screened with D32.39 and a six amino acid region of dynorphin B (RQFKVV), an opioid peptide, was found to be the preferred recognition sequence for D32.39.

Sequences were isolated by a method of the invention to isolate a DNA binding protein, or a peptide with specific affinity for a receptor. The method comprises providing a recombinant DNA vector encoding a peptide with specific affinity for a receptor. A library of oligonucleotides encoding different potential DNA binding proteins is inserted in-frame into the vector to create a fusion protein library. Host cells are transformed, and cultured to express the fusion protein. If a fusion protein comprises a potential DNA binding protein with affinity for the vector, the fusion protein binds to the vector to form a complex. The host cells are lysed to isolate the complexes which are contacted with a receptor to induce peptide binding to the receptor. The random peptide it binds to the wethod. The random peptides can be used for that bind receptor molecules of interest. The peptides can be used for the method of affinity enrichment allows a very large library of peptides to be screened, and by identifying the peptide de novo, the sequence or setructure of the receptor molecule or the natural binding partner of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

The present invention provides the sequences of 75 peptides which facilitate the uptake and transport of viruses, proteins and nucleic acids. These internalising peptides can be used for transport into the cytoplasm or the nucleus. They are useful for facilitating uptake into the cell, inducing apoptosis, for example in the treatment of arthritis and cancer, to expand a population of stem cells or differentiated cells to stimulate cell differentiation, facilitate the integration of AAV integenome of a cell, and to stimulate an immune response, for example the case of a HIV vaccine. The present sequence is one of the peptides of

nsefnj Antibodies against B Lymphocyte Stimulating polypeptides, u the diagnosis and treatment of cancers and immune disorders

3148pp; English 2952; 2; Page Claim

This invention describes novel antibodies that immunospecifically bine bymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention his cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS express and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (cvID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 repression the antibodies and fragments of the antibodies described in the meth the invention.

-1- FUNCTION: HAS ANTIBACTERIAL ACTIVITY AGAINST (GRAM-POSITIVE BACTERIA.

-1- SUBCELLULAR LOCATION: Secreted.

-1- TISSUE SPECIFICITY: Skin.

-1- SIMILARITY: Belongs to the brevinin family.

Amphibian defense peptide; Antibiotic; Amidation.

         of
"Contryphan-Vn: a novel peptide from the venom osnail Conus ventricosus.";
Biochem. Biophys. Res. Commun. 288:908-913(2001)
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom du
-!- MASS SPECTROMETRY: MW=1088.6; METHOD=MALDI.
-!- SIMILARITY: BELONGS TO THE CONTRYPHAN FAMILY.
Toxin; Amidation; D-amino acid.

"The small subunit of the mammalian mitochondrial ribosome:
identification of the full complement of ribosomal proteins present.";
J. Biol. Chem. 276:19363-19374(2001).
-!- SUBUNIT: Component of the mitochondrial ribosome small subunit
(28S) which comprises a 12S rRNA and about 30 distinct proteins.
-!- SUBCELLULAR LOCATION: Mitochondrial.
                                                                                                                                                                                                                                                                                                                                                   Gaps
